Consider a point \mathbf{x} equidistant from both parallel lines, then:

$$\frac{|a\mathbf{n}^T \mathbf{x} - c_1|}{\|a\mathbf{n}\|} = \frac{|b\mathbf{n}^T \mathbf{x} - c_2|}{\|b\mathbf{n}\|} \quad (2.0.5)$$

$$\frac{|a\mathbf{n}^T \mathbf{x} - c_1|}{|a|} = \frac{|b\mathbf{n}^T \mathbf{x} - c_2|}{|b|} \quad (2.0.6)$$

$$|ab\mathbf{n}^T \mathbf{x} - bc_1| = |ab\mathbf{n}^T \mathbf{x} - ac_2| \quad (2.0.7)$$

$$2ab\mathbf{n}^T \mathbf{x} - bc_1 - ac_2 = 0 \quad (2.0.8)$$

$$\mathbf{n}^T \mathbf{x} - \frac{1}{2} \left(\frac{c_1}{a} + \frac{c_2}{b} \right) = 0 \quad (2.0.9)$$

□

1 PROBLEM

(Linear_Forms/Q.2.15) Find the equation of the line equidistant from parallel lines

$$(9 \ 6)\mathbf{x} = 7 \quad (1.0.1)$$

$$(3 \ 2)\mathbf{x} = -6 \quad (1.0.2)$$

2 SOLUTION

In general, we can obtain the following lemma:

Lemma 2.1. Given the two following parallel lines:

$$a\mathbf{n}^T \mathbf{x} - c_1 = 0 \quad (2.0.1)$$

$$b\mathbf{n}^T \mathbf{x} - c_2 = 0 \quad (2.0.2)$$

The line equidistant from both parallel lines would be given by:

$$\mathbf{n}^T \mathbf{x} - \frac{1}{2} \left(\frac{c_1}{a} + \frac{c_2}{b} \right) = 0 \quad (2.0.3)$$

Proof. The distance between a point \mathbf{A} and a line $L = \mathbf{n}^T \mathbf{x} - c$ is given by:

$$\|\mathbf{P} - \mathbf{A}\| = \frac{|\mathbf{n}^T \mathbf{A} - c|}{\|\mathbf{n}\|} \quad (2.0.4)$$

where \mathbf{P} is the foot of perpendicular from \mathbf{A} onto L .

The two given parallel lines can be written as:

$$3(3 \ 2)\mathbf{x} - 7 = 0 \quad (2.0.10)$$

$$(3 \ 2)\mathbf{x} + 6 = 0 \quad (2.0.11)$$

On comparing the equations with (2.0.2),

$$\mathbf{n} = (3 \ 2) \quad (2.0.12)$$

$$a = 3 \quad (2.0.13)$$

$$b = 1 \quad (2.0.14)$$

$$c_1 = 7 \quad (2.0.15)$$

$$c_2 = -6 \quad (2.0.16)$$

On substituting these values into (2.0.9),

$$(3 \ 2)\mathbf{x} - \frac{1}{2} \left(\frac{7}{3} - 6 \right) = 0 \quad (2.0.17)$$

$$(3 \ 2)\mathbf{x} - \frac{11}{6} = 0 \quad (2.0.18)$$
